Milestone | London Transit Analysis

INTRODUCTION: In this Milestone, you will work with data provided by Transport for London (TfL), specifically from the Rolling Origin and Destination Survey (RODS). As a data analyst for Transport for London (TfL), your role is to support efforts to improve public transit operations through data-driven insights. TfL officials rely on a clear understanding of ridership patterns, peak travel times, and line usage to keep the system running smoothly and efficiently.

You're tasked with analyzing ridership data to uncover these trends. Your findings will help guide decisions on service scheduling, resource allocation, and infrastructure planning, ensuring that London's transport network continues to meet the needs of its millions of daily passengers.

HOW IT WORKS: Follow the prompts in the questions below to investigate your data. Post your answers in the provided boxes: the **yellow boxes** for the queries you write, **purple boxes** for visualizations and **blue boxes** for text-based answers. When you're done, export your document as a pdf file and submit it on the Milestone page - see instructions for creating a PDF at the end of the Milestone. Please *don't ever* remove (paste your query below 👇) or (write your **answer** below 👇). These help your Evaluator!

SQL App: Here's that link to our specialized SQL app, where you'll write your SQL queries and interact with the data.

— Data Set **Description**

The TfL RODS data (`tfl.rods`) models activity on the London Underground that would take place on a typical November weekday. The slice of the data that has been pulled out from the survey consists of 6295 rows across six columns:

- **`entry_zone`**: Zone of the station in which a passenger starts their journey. Zone 1 encompasses the central part of London, and each higher-numbered

Zone is a ring around the previous. In other words, Zone 5 represents stations that are furthest out from the central part of London. See here for a visualization of Zones in London.

- **`time_period`**: Time period in which the passenger started their trip. There are six periods of day: Early (5am-7am), AM Peak (7am-10am), Midday (10am-4pm), PM Peak (4pm-7pm), Evening (7pm-10pm), and Late (10pm-5am).
- **`origin_purpose`**: The reason for the passenger to have chosen the station from which they begin their journey. There are eight categories: Home, Work, Shop, Education, Tourist, Hotel, Other, and Unknown/Not Given.
- **`destination_purpose`**: The reason for the passenger to have chosen the station from which they end their journey. The possible values for this feature are the same eight categories as for the origin_purpose feature.
- **`distance`**: Approximate distance between the passenger's origin and destination stations. Distances are grouped into five levels: <3 km, 3–8 km, 8–16 km, 16–24 km, and over 24 km.
- **`daily_journeys`**: Number of daily journeys matching the entry, time period, purpose, and distance profile indicated by the data row. This number is derived from the RODS model, rather than a specific day of data collection.

— **Task 1:** General Usage Statistics

Although we'd like to eventually understand why passengers use the rail system, we should start by making some summaries of the rail system in general.

A. Write a query that returns the sum total of journeys. This total represents the volume of activity expected on a typical day of operations for the Underground system!

(paste your query below 👇)

```
SELECT
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
```

What is the total number of journeys expected on a typical day?

(write your **answer** below 👇)

4878330

B. Add to your query to return the number of journeys made that originate from each Zone.

(paste your query below 👇)

```
SELECT
  entry_zone,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  entry_zone
```

What percentage of journeys start from a Zone 1 station? **HINT:** (Divide the Zone 1 value by the value you got from part A; you won't calculate this in SQL!)

(write your **answer** below 👇)

(2522837 / 4878330) * 100 = 51.7%

C. Revise your query to return the number of journeys made in each period of day.

(paste your query below 👇)

```
SELECT
```

```
  time_period,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  time_period
ORDER BY num_journeys DESC
```

Which time period has the highest total volume of passengers?

(write your **answer** below 👇)

PM Peak with 1367309 passengers

— **Task 2:** For what reasons do people use the London Underground?

Let's start adding in the survey information about the reasons why passengers take trips on the subway system.

A. Write a query that returns the number of journeys made grouped by their reasons for the origin station.

(paste your query below 👇)

```
SELECT
  origin_purpose,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  origin_purpose
ORDER BY
```

```
  num_journeys DESC
```

Which journey purposes have the highest number of trips, and what does this tell you about how the subway system is used?

(write your **answer** below 👇)

> Home has the highest number of trips which suggests that people use the subway system to leave their home to go to another place for another purpose.

B. Change the grouping on your query to be on both the origin purpose and the destination purpose, so that you get the number of journeys by each origin-destination purpose pair.

Try this prompt: I'm trying to group my SQL query by both origin_purpose and destination_purpose, and I want to sum up daily_journeys for each pair. How should I write the GROUP BY clause when using multiple fields, and how can I sort the results so it's easy to see which combinations are most common?

(paste your query below 👇)

```
SELECT
  origin_purpose,
  destination_purpose,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  origin_purpose,
  destination_purpose
```

```
ORDER BY
  num_journeys DESC
```

Does this support or change your understanding of what you observed in the previous part?

(write your **answer** below 👇)

Home is a one of the main purposes people use the subway system for either the place they leave from or go to. This suggests that the understanding is the same but we get more insight on what people use the subway system more specifically for going from A to B.

C. Is there a bias in when people make their trips, depending on why they make a trip?

Modify your query to get the number of trips grouped by origin purpose and time of day. Sort by origin purpose so that all of the trips for a specific reason are returned together.

(paste your query below 👇)

```
SELECT
  origin_purpose,
  time_period,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  origin_purpose,
  time_period
ORDER BY
```

```
  origin_purpose
```

Interpret the output: Do people travel from Home or Work at the expected time periods?

(write your **answer** below 👇)

Yes it is expected that most people leave home in the morning and leave work in the afternoon. This shows the usual routine of people who leave home to go to work in the morning and leave work to go home in the afternoon. Although there are some other circumstances where people leave home in the afternoon and midday or evenings which could support other scenarios.

D. Is there a difference in travel purposes based on which zone is the trip origin?

Modify your query to get the number of trips grouped by origin purpose and entry zone. Sort by entry zone so that all of the frequency counts for a single zone are in consecutive rows.

(paste your query below 👇)

```
SELECT
  origin_purpose,
  entry_zone,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
GROUP BY
  origin_purpose,
  entry_zone
ORDER BY
  entry_zone
```

Interpret the output: how does the ranking of Home and Work purposes change as we change Zone?

(write your **answer** below 👇)

As the zones increase, the number of people making trips to leave work decreases which may suggest that work places tend to be lower in locations in higher zones. This is the same for the number of people making trips to leave home but is much less as there would be more residential areas than work places.

E. Now that you've explored patterns in the RODS dataset, it's time to think like a data analyst working with a real client. Transport for London (TfL) uses this type of data to improve how the transit system functions day-to-day.

Try this prompt: What does it mean if Zone 1 sees more people starting trips from work, while Zones 2–5 see more people starting from home? How might this pattern help city planners or transit authorities better understand urban flow?

Based on ChatGPT's response, what specific recommendation would you make to Transport for London (TfL) to enhance the efficiency, accessibility, or user experience of the transit system?

(write your **answer** below 👇)

To have more transport opportunities so possible, more trains or more space capacity in each train for people to commute from Zone 2–5 to Zone 1 and vice-versa for people going from Zone 1 to Zone 2–5.

— LevelUp

There's a lot of finer investigations that you can do with the RODS data, but it is most useful when you can focus your attention on just part of the data. We learned that the majority of rides for home/work happened during the peak times. Let's investigate how that changes for tourism related travel.

A. Write a query that returns the total number of journeys grouped by origin purpose, destination purpose, and time period. Filter to trips where either origin or destination is done for tourism purposes.

(paste your query below 👇)

```
SELECT
  origin_purpose,
  destination_purpose,
  time_period,
  SUM(daily_journeys) as num_journeys
FROM
  tfl.rods
WHERE
  origin_purpose = 'Tourist'
  OR destination_purpose = 'Tourist'
GROUP BY
  origin_purpose,
  destination_purpose,
  time_period
ORDER BY
  time_period,
  num_journeys DESC
```

How do travel periods for tourism related travel differ from those for work commute purposes?

(write your **answer** below 👇)

Less people often use trips to travel using the subway system compared to people using the subway system for work. People using the subway system for Tourism purposes seem to be using it primarily Midday while People using the subway system for Work uses it primarily during AM Peak and PM Peake

Next, you will learn about how to apply two different kinds of clauses to filter aggregated data in two different ways. But if you're excited about this dataset or want to think ahead, you can try your hand at applying the `WHERE` keyword you learned about previously. The `WHERE` clause comes after `FROM` and before `GROUP BY`. Try to see how adding a `WHERE` clause on one or two different journey purposes cleans up the output, and see if it makes it easier to see trends on some of the less-common trip reasons.

— Submission

Great work completing this Milestone! To submit your completed Milestone, you will need to download / export this document as a PDF and then upload it to the Milestone submission page. You can find the option to download as a PDF from the File menu in the upper-left corner of the Google Doc interface.
